No slides. No tabs. Just the product.

1. HÖMEPAGE (0:00)

Show: localhost:4242

April seventh.
Wireless Festival.
Cancelled.

50,000 fans stranded.
Flights booked.
Hotels non-refundable.
Ye banned from the UK.
Sponsors fled. Done.

Wireless wasn't special.
Over forty festivals cancelled
in 2025 alone.
Wildfires shut down Greek islands.
Airlines collapsed routes overnight.

Insurance exists for all of this.

Six and a half billion dollar market.

Growing to twenty-three billion by 2035.

But nobody under 35 has ever

voluntarily bought

an insurance policy.

They won't fill out claim forms.

They won't read policy documents.

But they will open

a collectible pack.

→ **CLICK "Open Packs" button**

2. PACK STORE (0:35)

Show: 4 pack tiers visible

A twenty-four billion dollar gaming market and a six and a half billion dollar insurance market were waiting for someone to connect them.

71% of blockchain gamers are 18 to 34.

The exact demographic that rejects insurance.

The exact demographic that opens packs.

→ **CLICK "Open Pack" on Starter Shield**

Wait ~3 seconds for cards to reveal

3. **PACK OPENED (0:55)**

Show: 3 cards, gold Wireless TRIGGERED

CrowdShield.

Each card is a real parametric
micro-insurance policy
on a real-world event.

Wildfires. Flight disruptions.
Festival cancellations. Pandemics.

That gold card?

Wireless Festival Cancelled.

Already triggered.
300 USDC paid out automatically
on April 7th.
No claim filed. No form.

Three seconds on Solana.

A five dollar pack.

Three hundred dollar payout.

Where does the money come from?

Most cards never trigger.
Every pack sold puts 55%
into the payout pool.

3. PACK OPENED (continued)

Trigger probabilities run 1 to 8 percent.
Thousands of expired cards fund
the few that fire.

Expected value per pack
stays below pack price.

The spread funds the pool.

**Same math as traditional insurance,
completely different experience.**

→ **CLICK the Greece Wildfire card**

4. CARD DETAIL (1:20)

Show: Wildfire card + odds + news

Scroll slowly so they see the depth

Every card has real data behind it.

This card: 67% trigger probability.

Based on ten years of
European Forest Fire data.

Seven of the last ten summers
exceeded the threshold.

Oracle source: EFFIS. Satellite-confirmed.

Binary: did wildfire exceed 500 hectares?

Yes or no. Oracle confirms, payout lands.

4. CARD DETAIL (continued)

The pricing uses a bonding curve.

Four variables multiplied:

controversy, demand, time, base rate.

This Wireless card:

90 days out, controversy 35,
premium was 10 USDC.

Sponsors pulled out, controversy 92,
premium jumped to 59 USDC.

One day before: 233 USDC
for a 300 USDC payout.

4. CARD DETAIL (continued)

Early buyers paid 3.5% of payout.

Late buyers paid 78%.

The curve rewards early conviction and makes it impossible to drain the pool because the last covers cost nearly as much as they pay out.

We built and tested this on Solana smart contracts.

The core logic works.

But production deployment needs security audits and hardened engineering.

That's what funding is for.

What you see here:

twelve cards, real oracle sources, working pricing engine, full consumer frontend.

We build fast.

→ **CLICK "Wireless Festival 2026"**

5. WIRELESS EVENT (1:55)

Show: Red CANCELLED banner, gauge at 92

Two products, two revenue streams.

Shield Packs: 20% platform take.

Event Shields: 12% spread on premiums.

Plus 5% royalties on secondary trades.

Ten thousand packs per month, ten events:
over a million dollars annually.

Organizers stake bonds.

Minimum 2% of ticket revenue.

Cancelled by organizer fault?

Bond gets slashed. On-chain. Automatic.

→ **SCROLL DOWN to Resolution Simulator**

→ **CLICK "Simulate: Event Cancelled"**

Wait ~3 seconds for payout animation

6. PAYOUT COMPLETE (2:25)

Show: Green checkmark, 300 USDC, 27.6x

Polymarket proved people want exposure to real-world events.

Two billion in volume.

But Polymarket is pure speculation.

Anyone can bet on anything.

War outcomes. Nuclear detonations.

Congress introducing bans.

CrowdShield is structurally different.

6. PAYOUT (continued)

Every card pays out based on
a parametric trigger.

Not opinion. Not a vote.

Verifiable data.

Satellite imagery. Flight network status.

Official government announcements.

The payout follows truth,

not consensus.

That eliminates moral hazard.

Nobody profits from causing the disaster.

The World Bank validated this model
across thirty countries.

We apply it to a generation
that traditional insurance ignores.

6. PAYOUT (continued)

Five actors in the system:

fans, organizers, LPs, traders, collectors.

Every actor's dominant strategy is

**individually optimal AND
collectively welfare-maximizing.**

No prisoner's dilemma.

Cooperation dominates.

5,400 projects in the Colosseum corpus.

Zero combine parametric insurance
with gamified distribution.

We want to be the first.

SLOW DOWN

10.86 USDC premium.

300 USDC payout.

Three seconds.

No form. No waiting.

PAUSE

CrowdShield.

Collect your shields.

Protect against chaos.

SILENCE — 3 SECONDS — DONE
